

Production Fax

Visit ReplixFax website for secure, reliable Cloud Fax Service for healthcare and financial industries.

The ReplixFax Fax Server supports a variety of production fax requirements ranging from high-volume, unattended application document delivery via fax to industry specific, ad-hoc fax processing needs.

High-Volume Faxing from Any Application

Production Fax automation allows high-volume documents to be electronically delivered without any manual intervention.

Using extensive sets of easy to use ReplixFax API's, the ReplixFax Fax Server integrates with virtually any business application, from e-mail and CRM to document management and mainframe, custom, legacy and Java applications, to automate electronic document delivery via fax with high availability and performance.

Batch Faxing Made Easy

The **ReplixFax Batch Loader Module** allows you to submit a batch fax request by using the ReplixFax Fax Control File. Each fax control file placed into a designated folder for outbound batch faxing will be read by the ReplixFax Server to process the batch fax request. The ReplixFax Batch Loader reads control files in the monitored folder that indicate fax parameters such as the fax number, and identifies documents to fax.

The ReplixFax Batch Loader offers flexible configuration options to work with various fax control file formats. The ReplixFax Batch Loader does not have to be installed on the same server that is running ReplixFax.

Production Fax Automation for Vertical Industries

The ReplixFax Fax Server is designed for mission critical enterprise fax applications. Supporting Fax Server Clustering, Fax Server Virtualization and comprehensive Fax APIs, the award-winning enterprise fax solution has been serving many vertical industries which heavily depend on document-intensive business processes to run their business.

Softlinx continues to provide Industry-specific **Fax Add-On Modules and Features** to support industry-specific requirements such as:

- **Automated Fax Back Acknowledgement for Financial Transactions:** The ReplixFax FaxAck Add-On module sends an acknowledgement fax back to the sender to confirm the receipt of submitted financial transaction request. This proactive acknowledgement module preempts any potential disputes between the financial services organization and its client.
- **Extended Retry for Guaranteed Delivery with Exception Reporting:** The extended retry feature maximizes the fax document delivery success to the recipient. It overrides standard, fixed number fax retry settings and initiates resend attempts driven by a customized algorithm in case the fax line is busy. Once the customized retry script is consumed, a custom exception alert is generated if the fax still has not been successfully delivered.
- **Integrated Barcode Recognition:** ReplixFax Barcode Extension module supports barcode embedded fax cover pages and barcode recognition from an incoming fax document. Barcode adds an intelligence to the incoming fax document that can be used to intelligently route the document. The barcode values, for instance, can be used for metadata fields to check-in the document to a content management system and trigger associated workflows.
